

At-risk account share is unusually high:
68 of NovaTech's 85 total accounts (80%) are currently flagged "at risk" under the ticket-volume + negative-sentiment criteria, with ACCT-041 the most extreme case at 334 tickets and \$40,722 in deal revenue.
Action: An 80% flag rate suggests either a genuine systemic support problem or a risk threshold that's too loose — recommend Sarah's team review the top 10–15 flagged accounts by revenue first (starting with ACCT-041) rather than treating all 68 as equally urgent.

Priority tiering isn't producing faster resolution:
Average resolution time is nearly flat across priority levels: critical tickets resolve in 56.1 hours vs. 58.9 hours for low-priority — essentially the same speed.
Action: critical-priority tickets should resolve meaningfully faster than low-priority ones; recommend that the support team audit their triage/escalation process, since the priority label doesn't currently appear to change queue behaviour.
